5. DESIGN RECOMMENDATIONS

5.1. Module Layout Recommendations

Follow these module layout recommendations:

- Antenna

For a module with on board chip antenna, to eliminate the influence from other components or ground, recommended that the module is placed in the corner of main PCB, and define a clearance area around the antenna, where no grounding or signal trace are contained. The clearance area applies to all layers of the main PCB. The recommended dimensions of the main PCB keep out area are shown in bellow.

- RF test point

There are RF test points in the bottom side of this module. It is only for module production used. Do not connect any signal to these test points (leave no connection) in the module. And do not design test point in the main board. Please reserve a clearance in the top-side copper plane underneath the RF test pads. Do not route any signal or place via in this keep out area.

- Device and Documentation Support

For a complete device and tool documents for the CC2640R2F platform, visit the Texas Instruments website at <http://www.ti.com>.

5.2. Reference Schematic

- No external decoupling is required.
- The reset line should have an external pullup resistor unless the line is actively driven. Placement of this component is not critical.
- All Digital Peripheral Pins can be routed to any GPIO.

7. SMT AND BAKING RECOMMENDATION

7.1. Baking Recommendation

- Baking condition :
 - Follow MSL Level 4 to do baking process.
 - After bag is opened, devices that will be subjected to reflow solder or other high temperature process must be
 - a) Mounted within 72 hours of factory conditions <30°C/60% RH, or
 - b) Stored at <10% RH.
 - Devices require bake, before mounting, if Humidity Indicator Card reads >10%
 - If baking is required, Devices may be baked for 8 hrs. at 125 °C.

7.2. SMT Recommendation

- Recommended Reflow profile :

No.	Item	Temperature (°C)	Time (sec)
1	Pre-heat	D1: 140 ~ D2: 200	T1: 80 ~ 120
2	Soldering	D2: = 220	T2: 60 +/- 10
